

Developer preview · 1.4

Finally, an agent that lives in your terminal.

Forge runs a coding agent inside your shell, your editor and your chat — real files, real commands, and approvals you actually control.

Install in 60 seconds

Read the docs

```
forge - zsh

$ npm i -g @forge/cli
$ forge "refactor the auth module and run the tests"
  → reading 14 files
  → editing 3 files
  → running pytest
  ✓ 42 passed in 3.1s
```

1.4.0
current release

Plugin API
extend every surface

WHY FORGE

Built for people who live in a shell.

No new editor, no new workflow. Your agent works where your code already is.

Real shell, real files

Runs commands and edits your actual project — not a sandbox toy. Git, pytest, npm, whatever you already use.

One agent, every surface

Start in the terminal, continue in the browser, hand off to Discord. Same session, same context, no re-explaining.

Approvals you control

Sandbox modes, per-tool grants and inline confirmations. Nothing runs without your say-so.

GET STARTED

Three commands to your first task.

- 1 Install the CLI globally with npm.
- 2 Open a terminal in the project you want to work on. No import, no index.
- 3 Ask in plain language. The agent reads, edits and runs your tests.

```
quick start

$ npm i -g @forge/cli
$ cd ~/your-project
$ forge
  session ready
```

Bring your agent home.

Free and open source. Install it, point it at a repo, and see what it does with the work you have been putting off.
